What You Need To Know About Private Drinking Water Wells

Don't just wish for safe water – Test for it!

Community drinking water systems are inspected and monitored under the supervision of the <u>Illinois</u> <u>Environmental Protection Agency (IEPA)</u>, while noncommunity drinking water systems are the responsibility of the <u>Illinois Department of Public</u> <u>Health</u> (IDPH). In addition, IDPH reviews water well installation plans, issues permits for new well construction, and inspects wells. However, **private** water well owners themselves have the primary responsibility to test well water for potential contaminants.

Groundwater (the source of fresh water for households with a well) can become contaminated in many ways; through contact with natural pollutants, such as arsenic and radon, and by human activities, such as chemical spills. The degree to which a potential health threat may exist depends on the amount and type of the contamination. In some cases, contamination of the water can be detected by sight, taste or smell; however, many of the most serious problems can only be detected through laboratory testing of the water.

This web site provides information and resources that will help you maintain safe drinking water in your well, including well water testing, potential contaminants, how to interpret test results, treating contaminated well water, well maintenance and tips, abandoned wells, proper location and construction of private
